Number of deliveries per page

When we have distribution days with many products on the routes, Dimap's mobile is very slow. This is because you see the entire list, and thus a lot of data that has to be processed when either swiping or scrolling.

In order to avoid that Dimaps Mobile is slow when there are many products on a distribution day, a functionality has been created that splits the list into several pages and thereby reduces the amount of data that must be processed. As a start, I have set the system to display 20 lines per page.

If you are used to scrolling up and down the list if the route is not in order, this can of course be a disadvantage. Therefore, it is recommended that the sequence is in place, otherwise you can choose to view the deliveries in alphabetical order.

We go into operation with this on Saturday 01-10-2022.

There are some changes in the appearance of Dimaps Mobile.
• Picture 1: An extra line has been added under the 2 blue boxes. In this line you can go from page to page, go to the last page and back to the first page again.
• Image 2: Click here if you want a dropdown with all pages that you can then jump to.
